Security Services

Cybersecurity Advantage

Real-World Expertise. Proven Security.

We know mid-sized business and security challenges because we have **decades of experience running companies**. Drawing on that real-world operational background, **we arm your team** with the **technical, process, and governance expertise** that fortifies your business against today's evolving threats. Our solutions align with your time, budget, and in-house capabilities. We don't just recommend security, **we implement, manage, and support you for the long term.**

Security Program Review (Trust, But Verify)

Independent review of your **cybersecurity program, defenses, and documentation** across risk, governance, architecture, network, and application security to **verify the right controls are in place.**

Security Program Development

Get **vendor, bank, and insurance-ready** with security policies, penetration testing, breach response, and third-party risk analysis; these can be promoted as a sales advantage and could lower your cyber liability expense.

Ransomware Defense & Recovery

Prevent, detect, contain, and recover—without paying a ransom. Build a plan to protect your **operations, reputation, and bottom line.**

Zero Trust Security & SASE Solutions

Future proof your security. Hide critical assets from the internet and **limit access to only what employees or contractors need.** Keep attackers out and stop lateral movement before it starts.

Application Security & Secure Development

Secure by design development for your applications starts with **architecture reviews, application security testing, and secure development lifecycle processes**—collectively forming a critical layer of your cyber defenses.
